

Certification Testing on Red Apps

18 June 2012

Certification Testing

Some of the tests that *Sabre* will conduct on your *Red App* during the certification process follow:

- The Certification Engineer will review the proposal for completeness and accuracy.
- The Certification Engineer will test that the application meets all requirements in the stated *Red App* Security Requirements.
- The Certification Engineer will scan the *Red App* binary for vulnerabilities.
- The Certification Engineer will use a log crawler tool and/or other investigative methods, and verify that cardholder data, especially sensitive authentication data (full magnetic stripe data, CVV or Pin0 and PAN or personal identifying data) is **not** stored in any unexpected locations, such as portable digital media, backup media, log files, temp files, unprotected/free text fields, etc.
